

# DUPLICATE / SIMILARITY SCREENING REPORT

## Healthcare Service and Patient Data Visualization Analytics System

**Document screened:** Healthcare\_Data\_Visualization\_Analytics\_Report.pdf

**Document length:** 32 pages

**Screening type:** Moderate duplicate-content and originality review

**Important note:** This is an internal text-based screening of the supplied document. It is not a Turnitin/iThenticate database match and cannot provide a verified internet-wide plagiarism percentage.

### 1. Overall Screening Result

| Check Area                        | Result       | Assessment                                                                                                |
|-----------------------------------|--------------|-----------------------------------------------------------------------------------------------------------|
| Repeated content within document  | Low          | No major section appears to be copied repeatedly word-for-word.                                           |
| Section-to-section overlap        | Low–Moderate | Some ideas are repeated naturally in the conclusion, analysis and reflection.                             |
| Template/common academic wording  | Moderate     | Technical phrases and standard visualization terminology may resemble other academic work.                |
| Reference/source material         | Low concern  | External concepts and software are identified in the references.                                          |
| Original project-specific content | Good         | Dataset details, correlations, PCA results, t-SNE timings and test cases are specific to this assignment. |
| Overall duplicate-content risk    | Low–Moderate | The project-specific content is distinctive, with some unavoidable standard wording.                      |

## 2. Natural Repetition Identified

**Conclusion vs. Results/Analysis:** Key findings such as  $r = 0.75$ ,  $r = -0.49$ , 52.2% PCA variance and the PCA/t-SNE comparison are summarized again. This is normal academic practice.

**Student Reflection vs. Methodology:** The reflection refers back to visualization selection, data types, PCA and t-SNE. These references are contextual rather than suspicious duplication.

**Analysis/Trade-offs vs. Visualization Sections:** The report explains each visualization and later compares alternatives. The overlap is purposeful and supports the justification.

## 3. Originality Strengths

- The report uses a synthetically generated 10,000-record healthcare dataset with a documented generation process and fixed seed.
- It contains assignment-specific numerical results, including correlations, skewness values, PCA loadings, variance percentages and execution times.
- The ten test cases provide project-specific validation evidence.
- The PCA and t-SNE discussion is connected to the variables and findings of this dataset.
- The student reflection describes specific visualization decisions and implementation challenges.
- The references identify the external software, books and research material used.

## 4. Similarity Risk Areas

- Common terms such as data visualization, correlation analysis, dimensionality reduction, PCA, t-SNE, heatmap and boxplot are standard technical terminology.
- Generic explanations of visualization principles can naturally resemble textbook or educational wording.
- Reference entries and software names are not plagiarism evidence by themselves.
- Some conclusion statements repeat earlier findings; wording can be varied if a lower similarity score is required.

## 5. Recommended Improvements

- Rewrite generic theoretical explanations in simpler, personal wording.
- Keep technical terms unchanged where accuracy requires them, but vary the surrounding explanation.
- Reduce unnecessary repetition of numerical findings across results, conclusion and reflection.
- Add a few original observations based directly on the implementation experience.
- Keep citations for concepts, documentation and published methods.
- For an official similarity percentage, use the institution-approved Turnitin, iThenticate or equivalent checker.

## 6. Moderate Final Assessment

**Duplicate-content risk:** LOW–MODERATE

**Overall originality assessment:** SATISFACTORY

The supplied report does not show strong evidence of extensive internal duplication. Most repeated material follows a normal academic structure: methods are interpreted in the analysis, key findings are summarized in the

conclusion, and the reflection refers to decisions made during the project. The report also contains substantial project-specific information.

For stronger originality, generic explanatory sentences can be paraphrased while preserving technical terminology and citations. A verified internet-wide plagiarism percentage cannot be determined from the document alone.

## **7. Final Verdict**

**PASS – with minor originality improvements recommended**
